## Chap 14 Team Problems

Problem \#1
Ammonium carbamate, $\mathrm{NH}_{4} \mathrm{CO}_{2} \mathrm{NH}_{2}$, decomposes according to the following reaction:
$\mathrm{NH}_{4} \mathrm{CO}_{2} \mathrm{NH}_{2(\mathrm{~s})} \leftrightarrow 2 \mathrm{NH}_{3(\mathrm{~g})}+\mathrm{CO}_{2(\mathrm{~g})}$
Some ammonium carbamate is put into an evacuated container at $40^{\circ} \mathrm{C}$ and allowed to come to equilibrium, the pressure in the container is found to be 0.363 atm . What is the equilibrium constant $\mathrm{K}_{\mathrm{p}}$ ?

## ANSWER:

Using Dalton's Law of Partial Pressures:
$\mathrm{P}_{\text {total }}=\mathrm{P}_{\mathrm{NH} 3}+\mathrm{P}_{\mathrm{CO} 2}=0.363 \mathrm{~atm}$
Based on the reaction, there is a $2: 1$ ration of $\mathrm{NH}_{3}: \mathrm{CO}_{2}$
Therefore, $2 \mathrm{x}+\mathrm{x}=0.363$ atm
Solving for x

$$
\mathrm{x}=0.121 \mathrm{~atm}
$$

The equilibrium expression for this reaction is:
$\mathrm{K}_{\mathrm{p}}=\left[\mathrm{NH}_{3}\right]^{2}\left[\mathrm{CO}_{2}\right]$
This means:

$$
[2 \mathrm{x}]^{2}[\mathrm{x}]=\mathrm{K}_{\mathrm{p}}
$$

Using the value of " $x$ " from above: $[2(0.121 \mathrm{~atm})]^{2}[0.121 \mathrm{~atm}]=\mathrm{K}_{\mathrm{p}}$
Solving: $\mathrm{K}_{\mathrm{p}}=7.09 \mathrm{e}-3$

## Problem \#2

The dissociation of molecular iodine into iodine atoms is represented by:

$$
\mathrm{I}_{2(\mathrm{~g})} \leftrightarrow 2 \mathrm{I}_{(\mathrm{g})}
$$

At 1000 K the equilibrium constant, $\mathrm{K}_{\mathrm{c}}=3.80 \mathrm{e}-5$. Suppose you start with 0.0456 mol of $\mathrm{I}_{2}$ in a 2.30 L flask at 1000 K and allow it to come to equilibrium. What are the concentrations of the molecular iodine and of the iodine atoms?

ANSWER
In order to use an ICE chart, we must have the concentration of the initial $\mathrm{I}_{2}: 0.0456 \mathrm{~mol} / 2.30 \mathrm{~L}=0.0198 \mathrm{M}$
Now run an ICE chart:

|  | $\mathrm{I}_{2(\mathrm{~g})}$ |  |
| :--- | :--- | :--- |
| Initial 0.0198 M |  | $\mathrm{I}_{(\mathrm{g})}$ |
| Change -x | 0 M |  |
| Equil. $0.0198-\mathrm{x}$ | 2 x |  |

Plug into the equilibrium expression: $\mathrm{K}_{\mathrm{c}}=[\mathrm{I}]^{2} /\left[\mathrm{I}_{2}\right]=[2 \mathrm{x}]^{2} /[0.0198-\mathrm{x}]=3.80 \mathrm{e}-5$
Assuming " $x$ " is less than $5 \%$ of 0.0198 , solve for " $x$ ": $x=4.34 e-4(4.34 e-4 / 0.0198=2 \%$ Hooray!)
Use this to calculate the equilibrium concentrations:
$\left[\mathrm{I}_{2}\right]=0.0194 \mathrm{M},[\mathrm{I}]=8.68 \mathrm{e}-4 \mathrm{M}$
